

Watershed Hydrology in Earth-Human Dialogue

Hong-Yi Li

*Seminar on November 07, 2016
LRES/MSU*

- **Background:** classic watershed modeling
- ~~Watershed scale modeling~~
- ~~Watershed data analysis~~
- **Modeling beyond watersheds**
- **Future research**
- **Summary**

Classic definition of watershed

- A watershed is that **area** of land bounded hydrologically by a common **waterway**, such as a stream, river, lake, reservoir, wetland, aquifer, or even the ocean (US EPA)

Everyone lives in
a watershed

- ▶ A watershed is that **area** of land bounded hydrologically by a common **waterway**, such as a stream, river, lake, reservoir, wetland, aquifer, or even the ocean (US EPA). Watersheds are inextricably linked by their **water** and where, as **humans** settled, simply **water** demanded that they become part of a community (John W. Powell)

Watershed is
NOT just about
water

Classic watershed modeling

-- Spatial heterogeneity within watersheds

(Li et al., HESS, 2010)

(Li et al., WRR, 2011) (Li et al., JOH, 2012)

Moving beyond watersheds

– An Earth-Human system perspective

<http://science.nasa.gov>

Current Earth system models lack of physical representation of rivers

Atmosphere only

Land and clouds

“Swamp” ocean

Deep ocean

Simple rivers

Veg. and atmo. chemistry

Current status of river representation

in earth system models

Typical example:

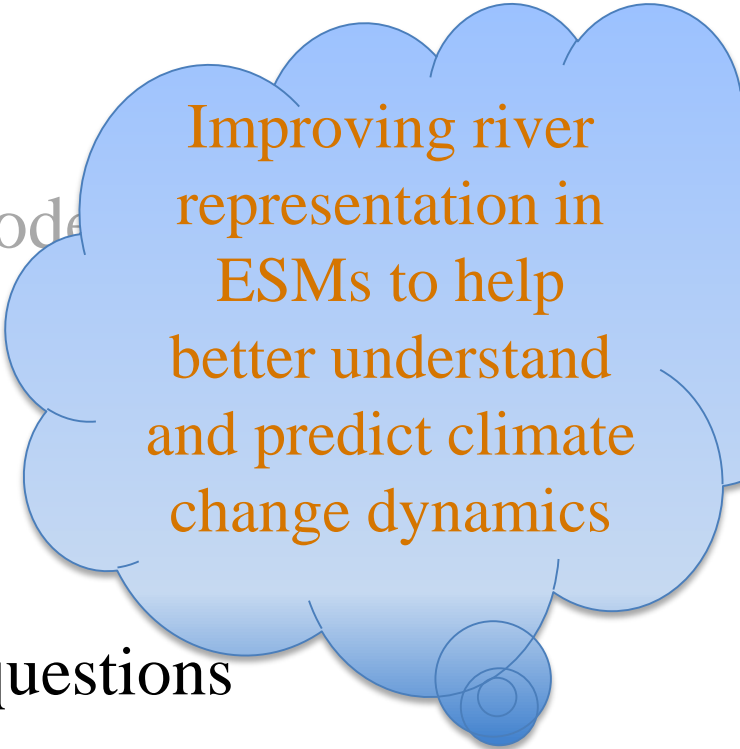

River Transport Model (RTM)

in Community Land Model (CLM, v4.0 and v4.5)

- Oversimplification of important riverine dynamics (e.g., River Transport Model in Community Earth System Model)
 - Lack of sub-grid heterogeneity representation
 - Assuming constant, globally uniform channel velocity
- No representation of human impacts
- No representation of riverine energy and biogeochemistry

Outline

- **Background:** classic watershed models
- **Modeling beyond watersheds**
 - Improving riverine dynamics
 - Incorporating human component
 - Using model as a tool to answer questions
- **Future vision**
- **Summary**

Improving river representation in ESMs to help better understand and predict climate change dynamics

Scale adaptive river transport

Real River Network

Conceptualized River Network

Model for Scale-Adaptive River Transport (MOSART)

▶ Hillslope routing:

- Account for impacts of overland flow on soil erosion, nutrient loading, etc.

▶ Sub-network routing:

- Scale adaptive across different resolutions to reduce scale dependence

▶ Main channel routing:

- Explicit estimation of in-stream conditions (velocity, water depth, etc.)

▶ Model streamflow and stream temperature

- Being extended to include river biogeochemistry

A comprehensive global hydrography database

To support application of MOSART

Drainage area

Channel bankfull width

Drainage density

Channel bankfull depth

All parameters available at

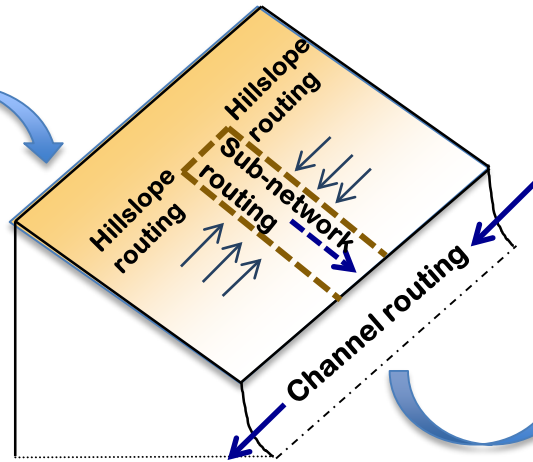

1/16, 1/10, 1/8, 1/4, 1/2, 1 and 2 degree resolutions

Coupling MOSART to Community Land Model

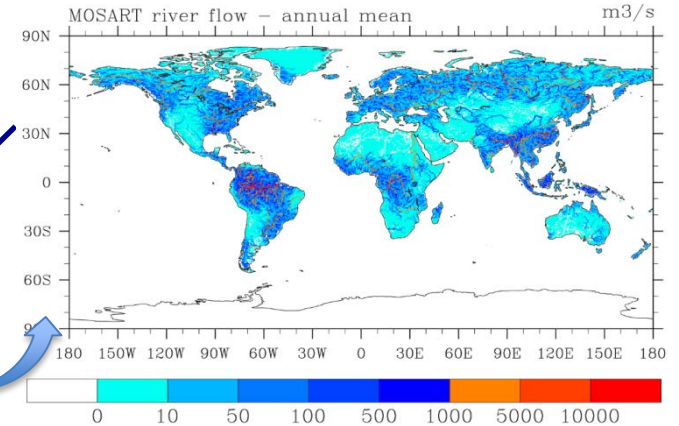

CLM Hydrology

MOSART

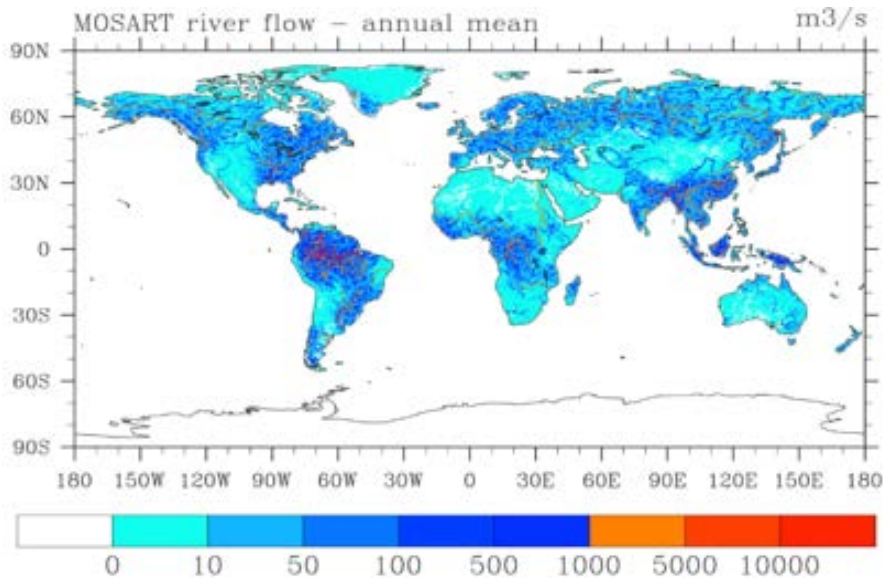

Coupled CLM-MOSART Simulation

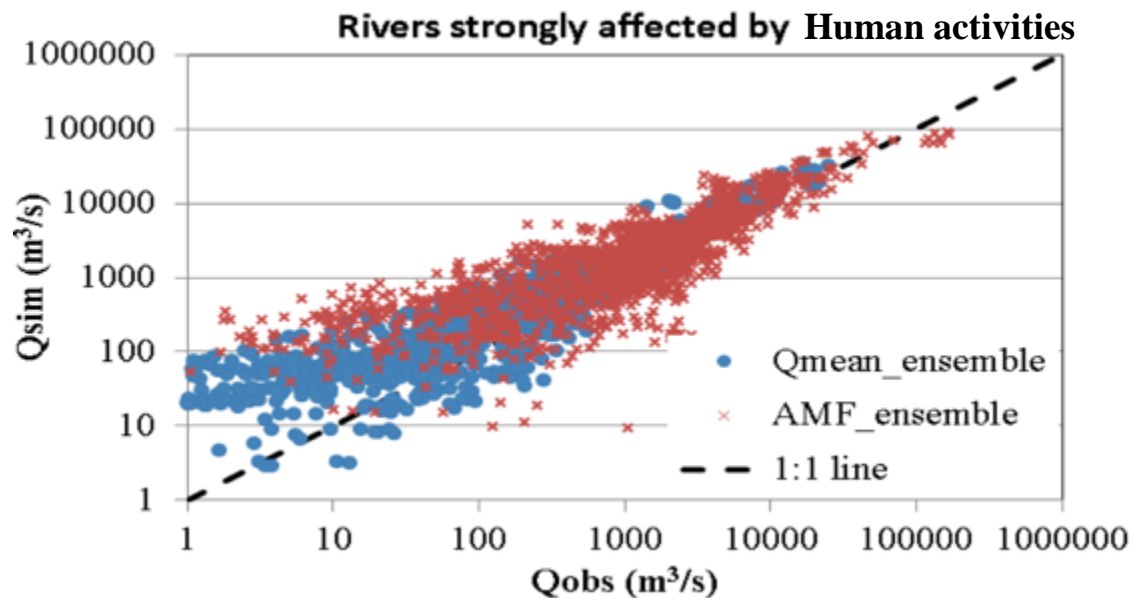

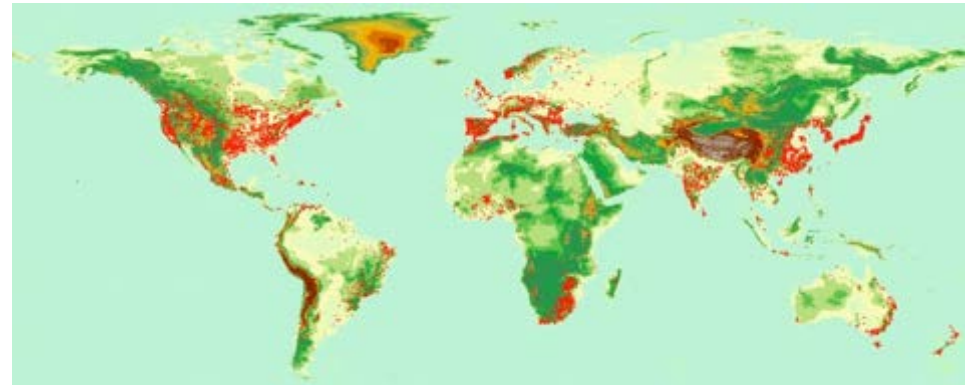

(Li et al., JHM, 2015)

Large human influence on streamflow

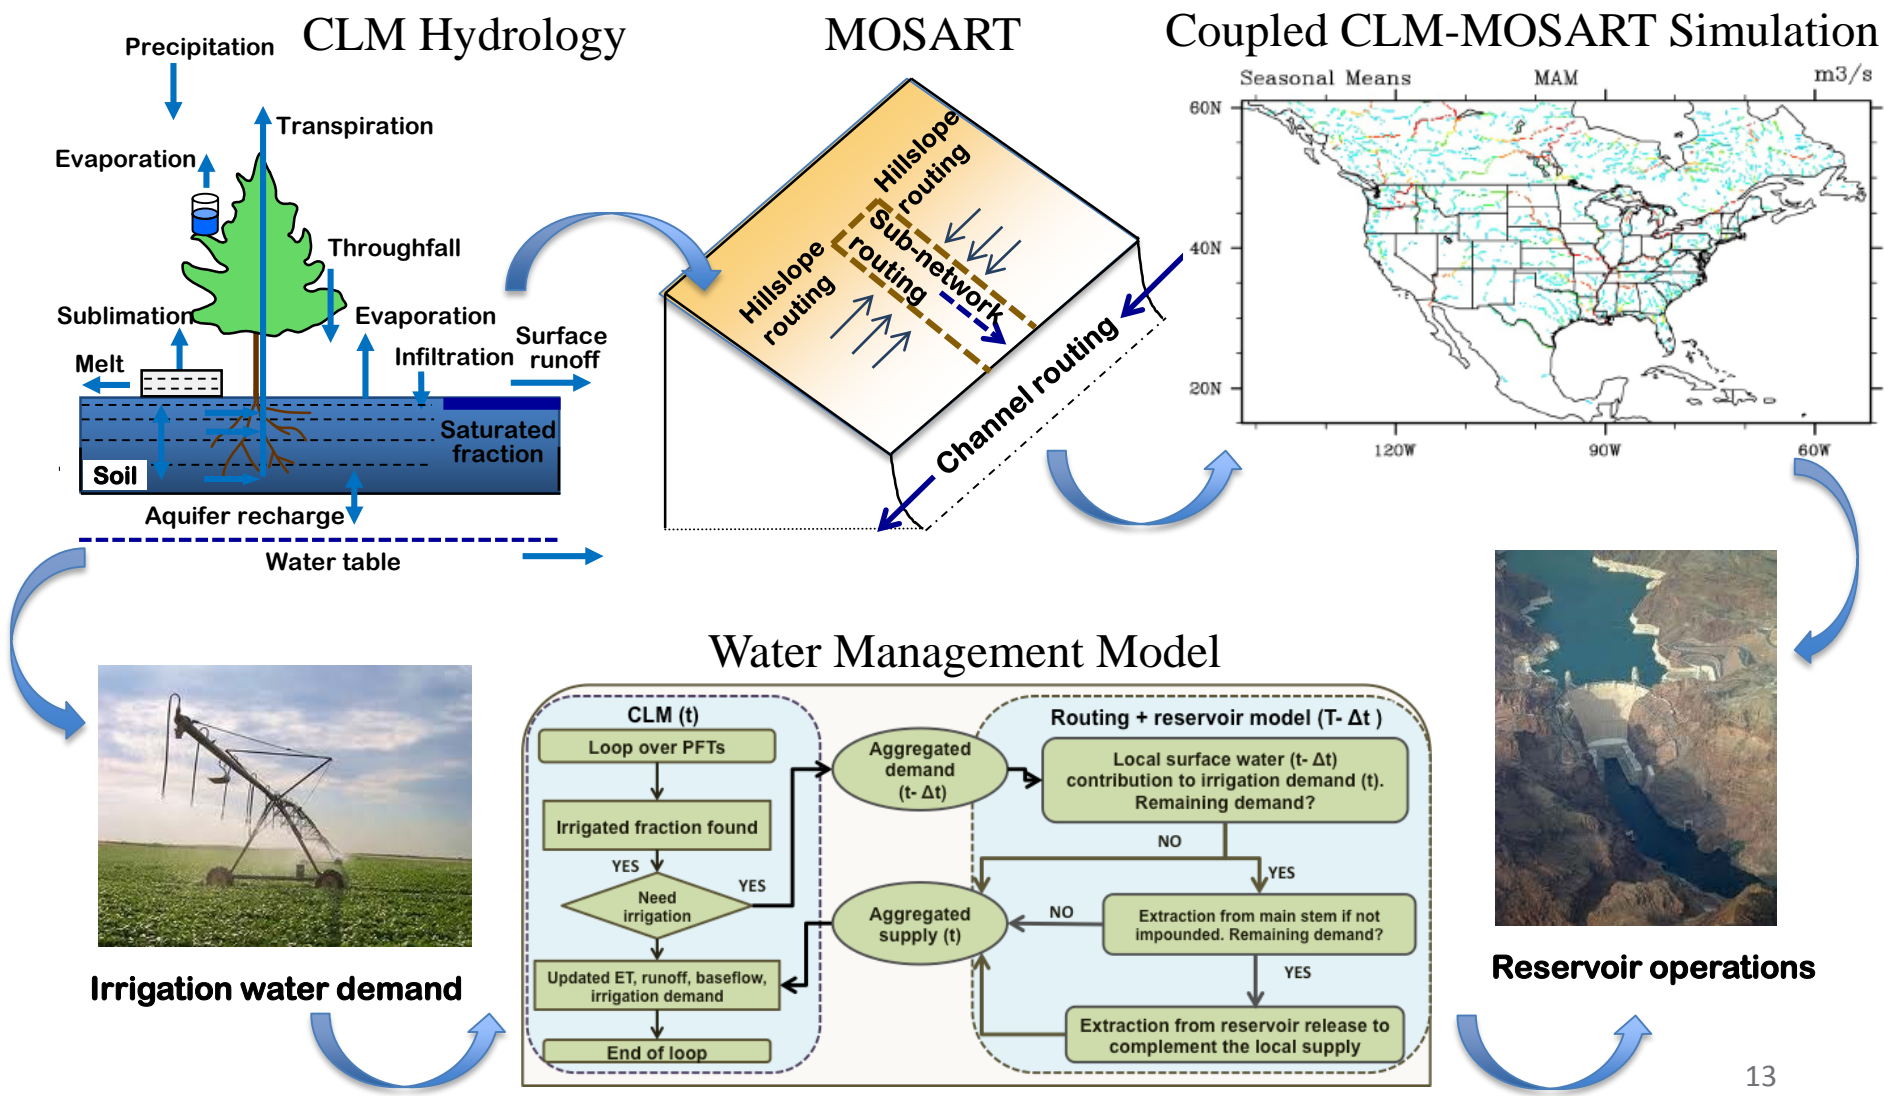

Global distribution of dams

Adding human component to river modeling

-- An Earth-Human modeling framework

(Voisin et al., HESS, 2013; Li et al., JAMES, 2015)

Two characteristics of water management

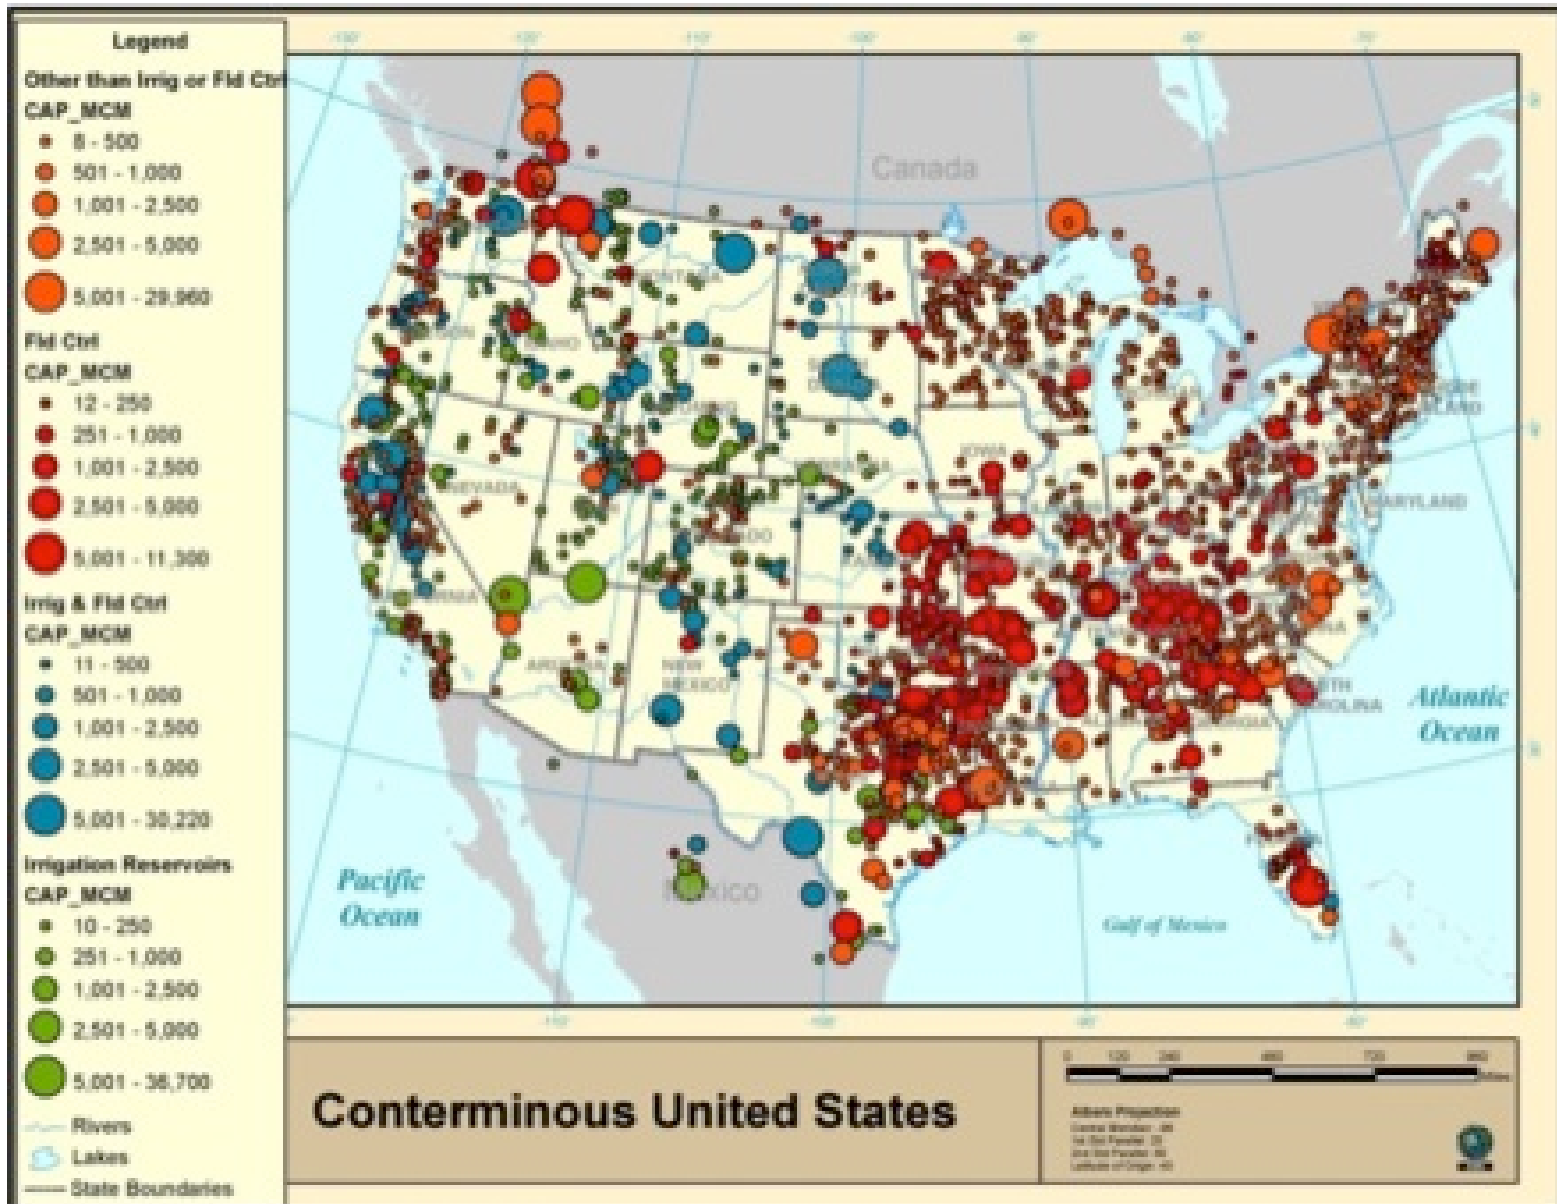

Local water extraction:
reduce flow year round

Reservoir operations:
enhance summer low flow

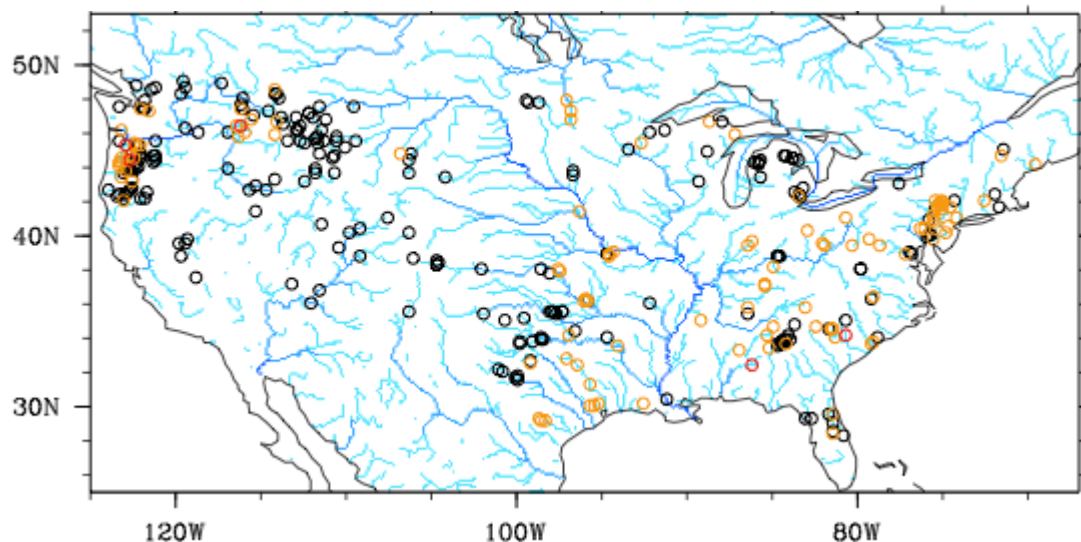

Modeling water management in the US rivers

- A total of 1839 reservoirs in the US are represented

Adding water management leads to improved streamflow simulation

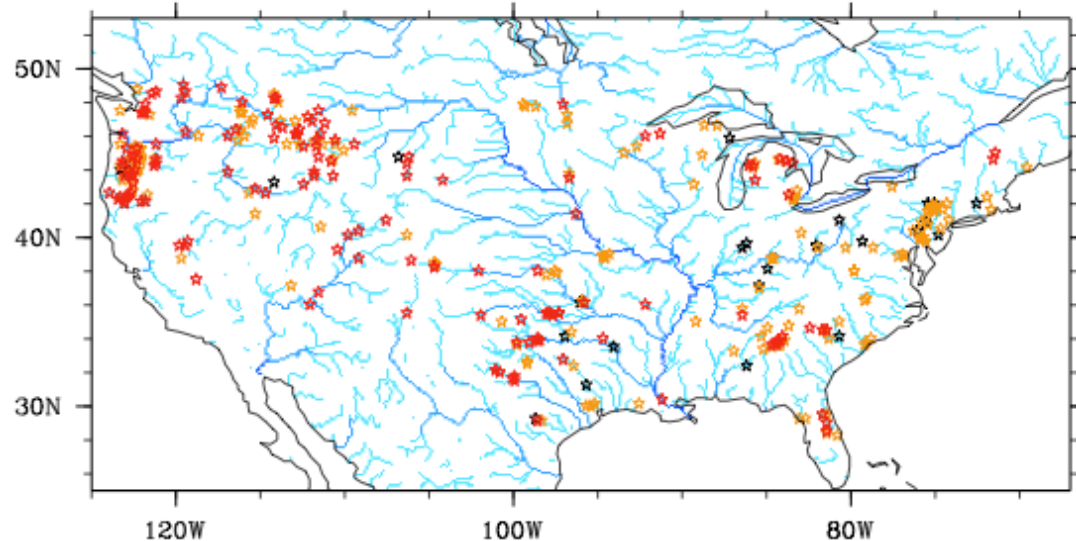

NS coeff. w/o WM

- $NS_{nat} < 0.0$
- $0 \leq NS_{nat} \leq 0.5$
- $NS_{nat} > 0.5$

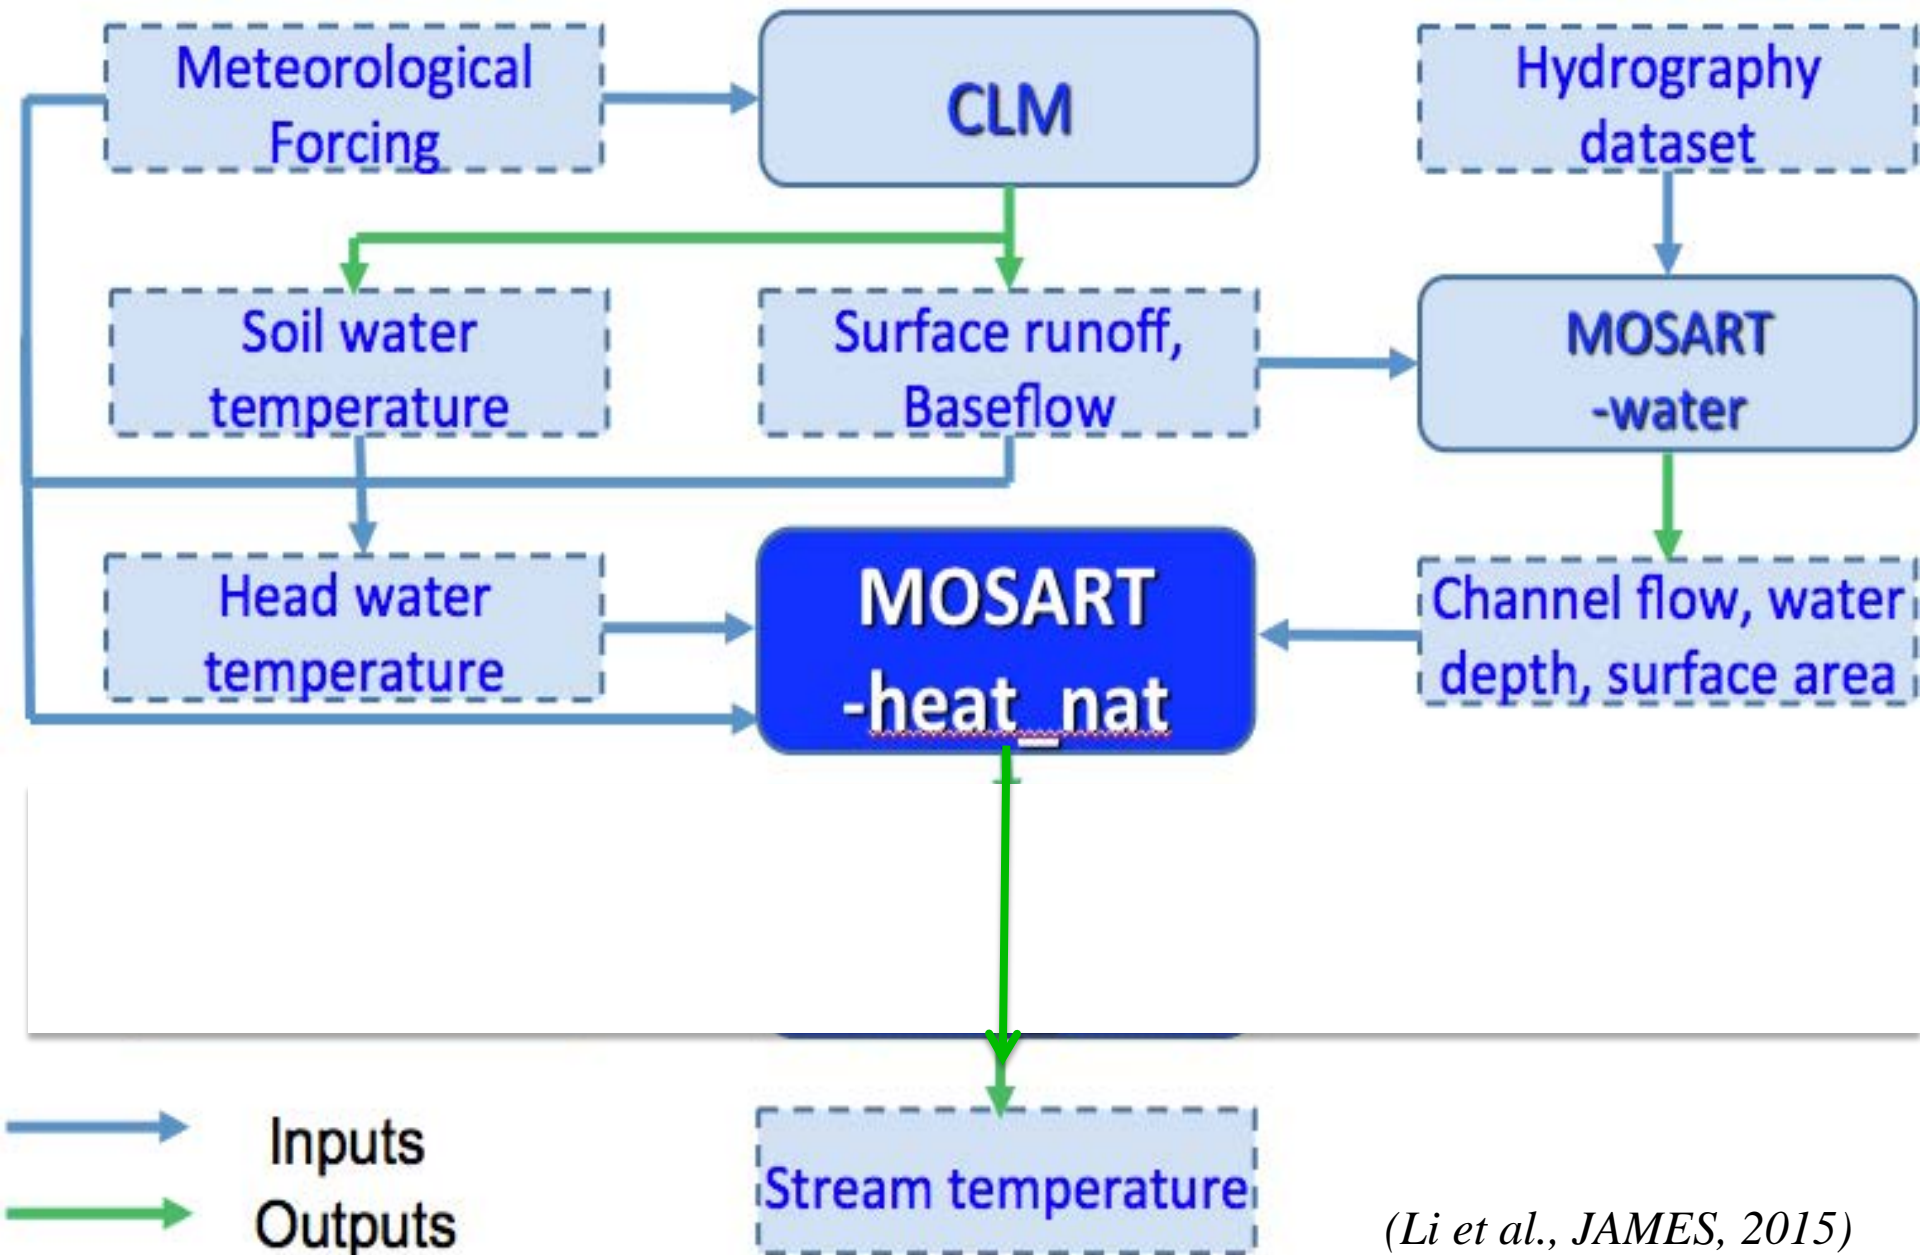

Change of NS coeff. After including WM module

- ☆ $NS(wm0) - NS(nat) < -0.05$
- ☆ $-0.05 \leq NS(wm0) - NS(nat) \leq 0.05$
- ☆ $NS(wm0) - NS(nat) > 0.05$

Riverine transform & transport of energy

– An Earth-Human modeling framework

Riverine transform & transport of energy

-- Effects of reservoir regulation in large rivers

ASO ($Q_{wm0} - Q_{nat}$)/ Q_{nat}

Aug., Sept. and Oct. (ASO)
as a low flow season with
high temperature

Increasing of
flow by dam
regulation

Decreasing of
water temp.

ASO ($T_{wm0} - T_{nat}$)

Celcius

Science questions

- How does climate change influence water, energy, and their connections?
- How does human intervention (mitigation, adaptation, and management) alter climate change impacts?
- What are the regional characteristics of the above impacts and their drivers?

Numerical experiments

Historical

No-mitigation scenario
RCP8.5

Mitigation scenario
RCP4.5

Not just GHG and aerosol emissions; LULC and water use are important parts of the mitigation

Regional climate model
(Atmospheric forcing)

HIST_NAT

RCP4.5_NAT

RCP8.5_NAT

Community Land Model
(Runoff and soil temperature)

HIST_WM

RCP4.5_WM

RCP8.5_WM

MOSART

(Streamflow and stream temperature)

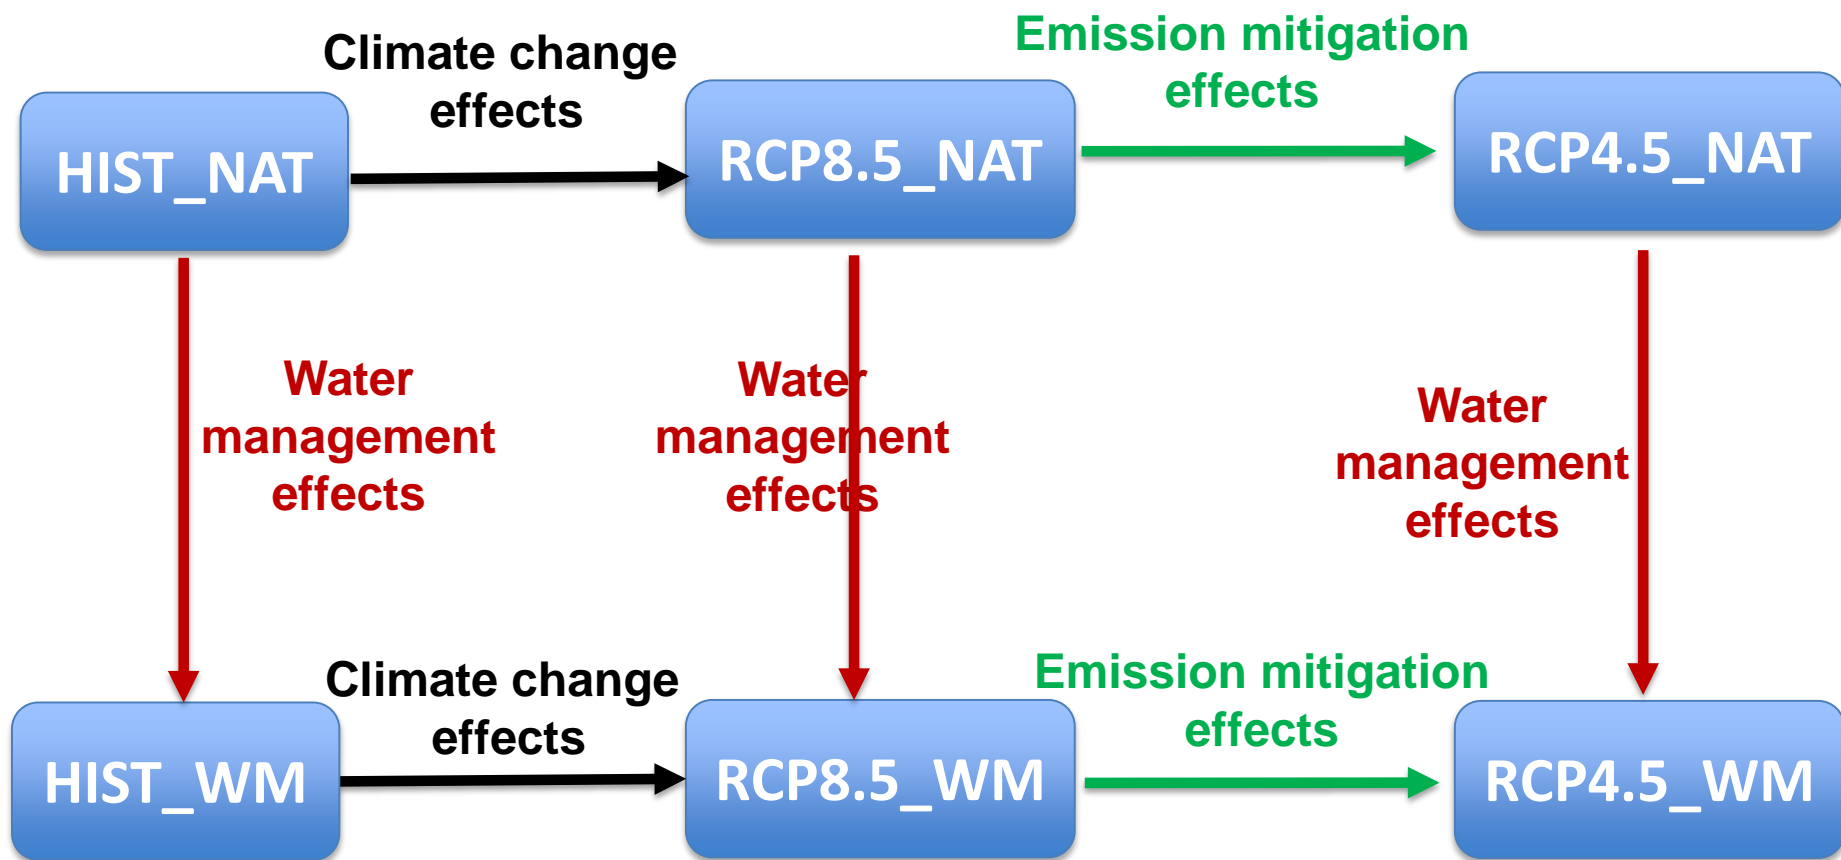

RCP4.5

RCP8.5

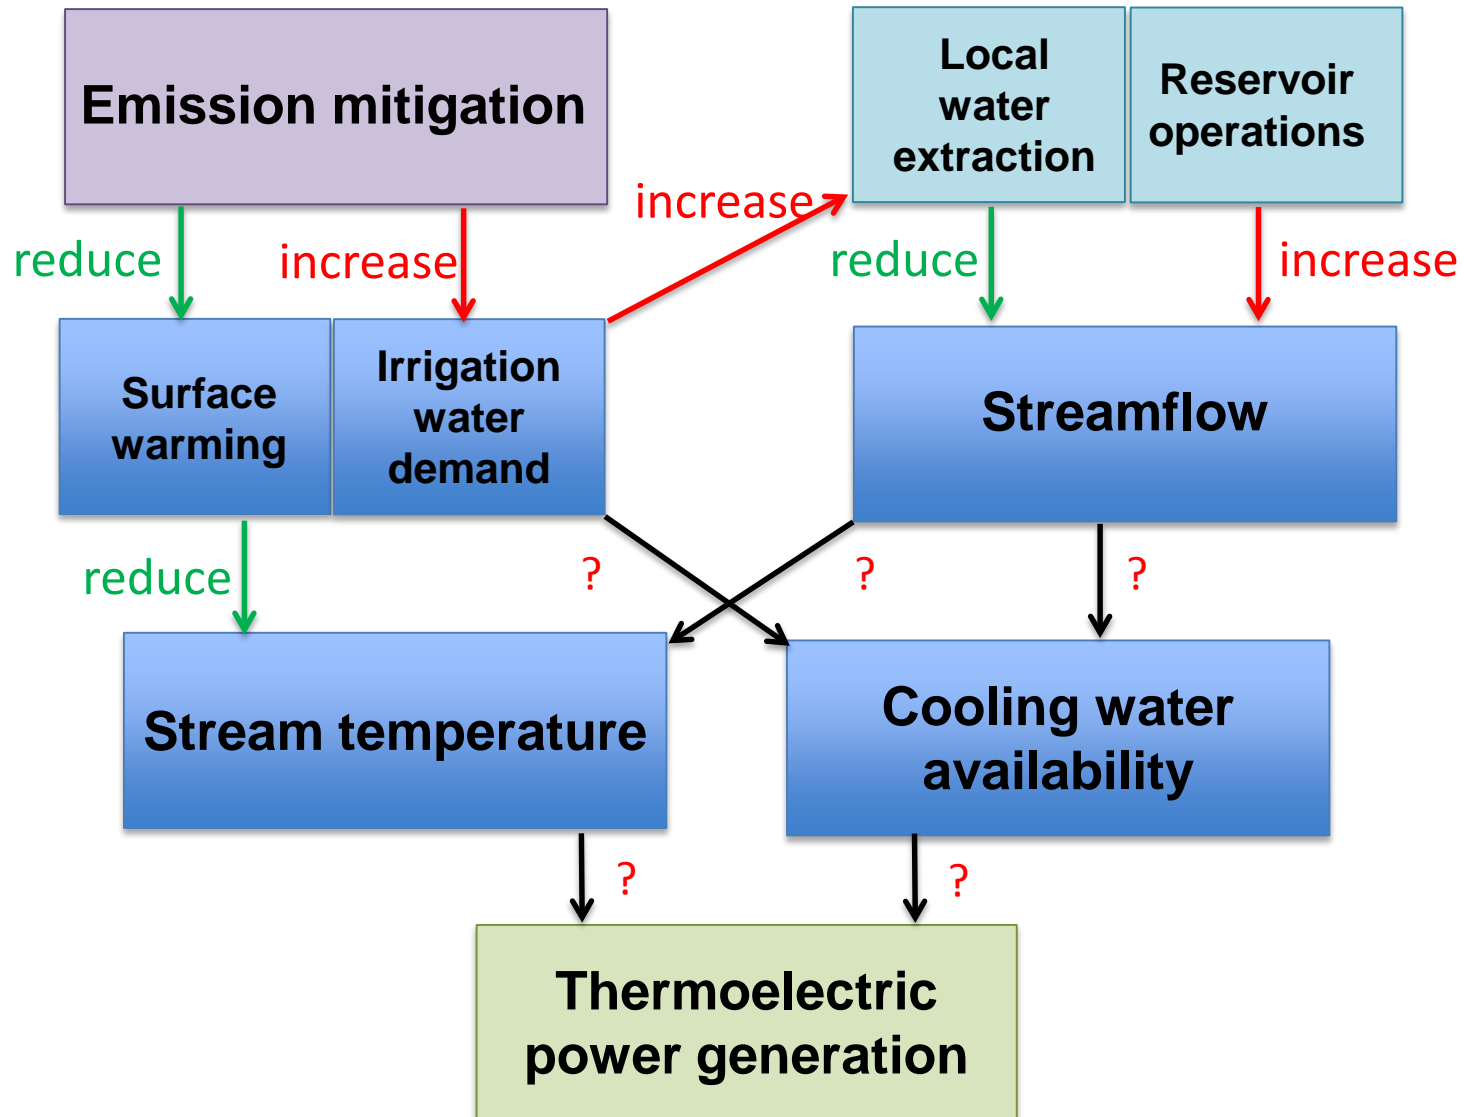

GCAM
(Water demand)

Water Management
(Local extraction / reservoir operations)

Effects of climate change & mitigation

Climate change impacts: emission mitigation vs. water management

Changes in stream temperature

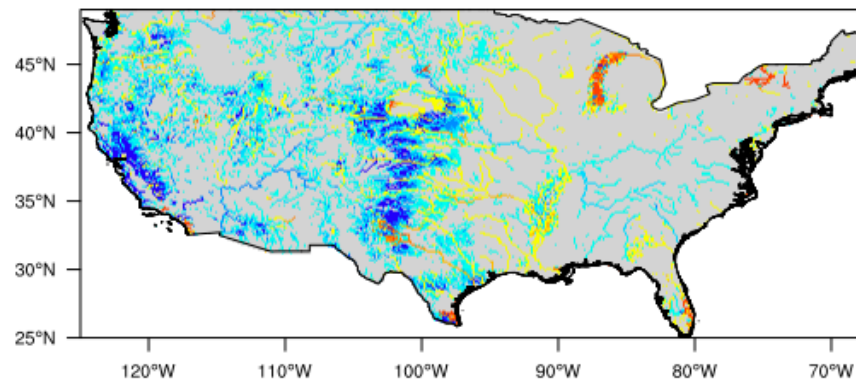

**Climate change effects
(future minus historical)**

**Emission mitigation effects
(RCP8.5 minus RCP4.5)**

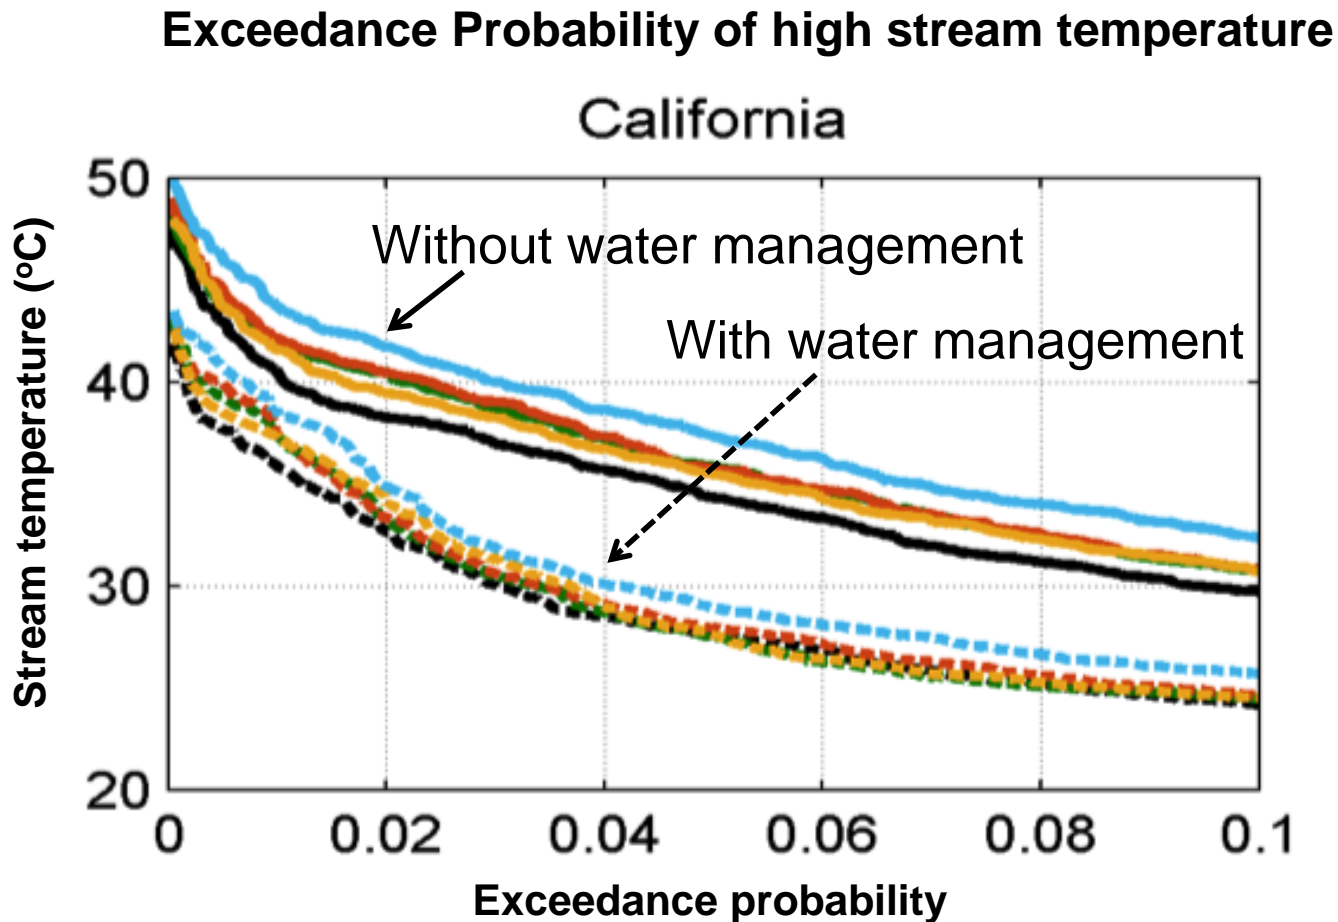

**Water management effects
(with_WM minus without_WM)**

Likelihood of extreme high stream temperature

- Water management substantially reduces the likelihood of extreme high stream temperature in western river basins by enhancing summer low flows

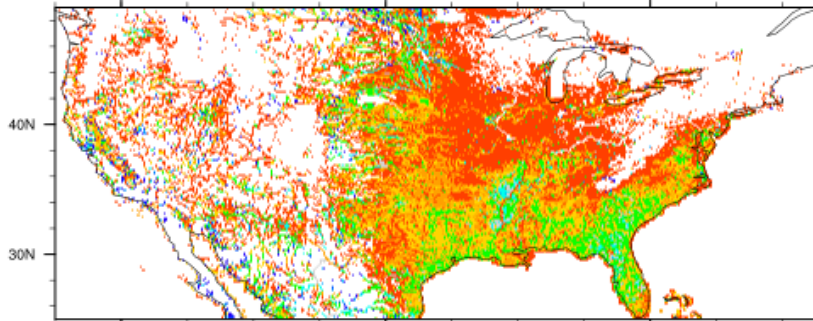

Frequency changes for stream temperature > 27°C

Water management reduces exceedance frequency

Emission mitigation reduces exceedance frequency

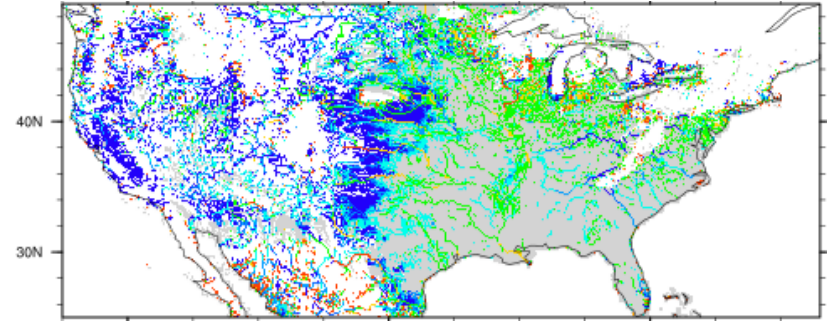

$(RCP4.5_NAT - HIST_NAT) / HIST_NAT$ %

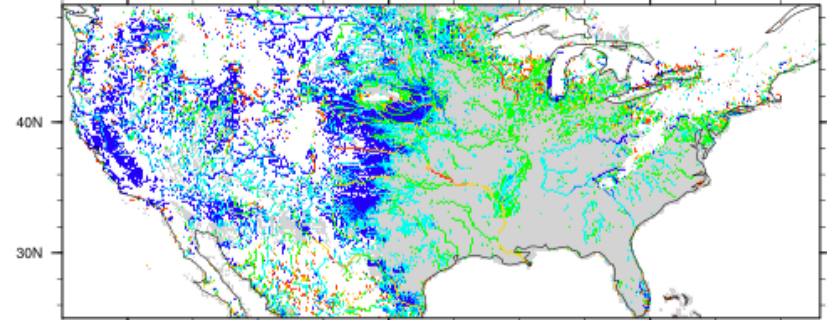

$(RCP8.5_NAT - HIST_NAT) / HIST_NAT$ %

$(RCP4.5_WM - RCP4.5_NAT) / RCP4.5_NAT$

$(RCP8.5_WM - RCP8.5_NAT) / RCP8.5_NAT$

% change in number of hours with stream temperature > 27°C

Impacts of stream temperature on thermoelectric power production

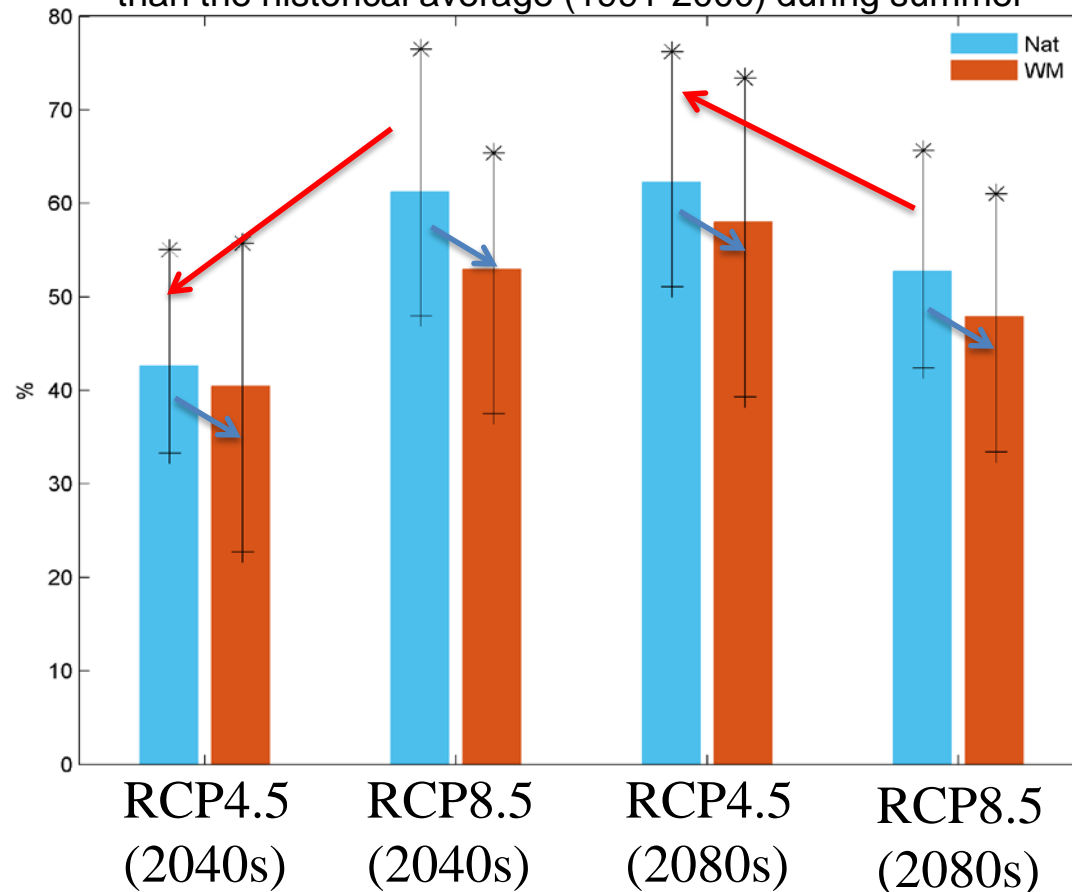

- Estimated based on 177 once-through power plants, which account for about 76% of once-through thermoelectric power plants in the US
- Both emission mitigation and water management reduce power loss from climate change at similar level

Loss (%)	RCP4.5_NAT	RCP8.5_NAT	RCP4.5_WM	RCP8.5_WM
2040s	10.6	11.1	10.0	10.5
2080s	14.0	15.1	13.3	14.4

Impacts of cooling water availability on thermoelectric power production

- There is no consistent difference in cooling water availability between RCP4.5 and RCP8.5 due to large inter-decadal variability in precipitation
- Water management consistently alleviates the duration of low water availability by 5%-14%

Percentage of time when projected inflows (2040s and 2080s) are lower than the historical average (1991-2000) during summer

Answers to science questions

- *How does climate change influence water, energy, and their connections?*
 - Warming increases stream temperature – reduces thermoelectric power generation
 - Warming has variable effects on regional precipitation and cooling water availability
- *How does human intervention (mitigation, adaptation, and management) alter climate change impacts?*
 - Emission mitigation reduces warming, but its impacts on regional water availability are variable
 - Water management consistently alleviates high stream temperature and reduces thermoelectric power generation loss
- *What are the regional characteristics of the above impacts and their drivers?*
 - Regional drivers: local water extraction, reservoir regulations, and water demand
 - Impacts of different scenarios must account for LULC and water use

Outline

- Background: Classic watershed modeling
- Modeling beyond watersheds
- **Future research**
- Summary

– overarching goal

Earth System

Hydrology System

Human System

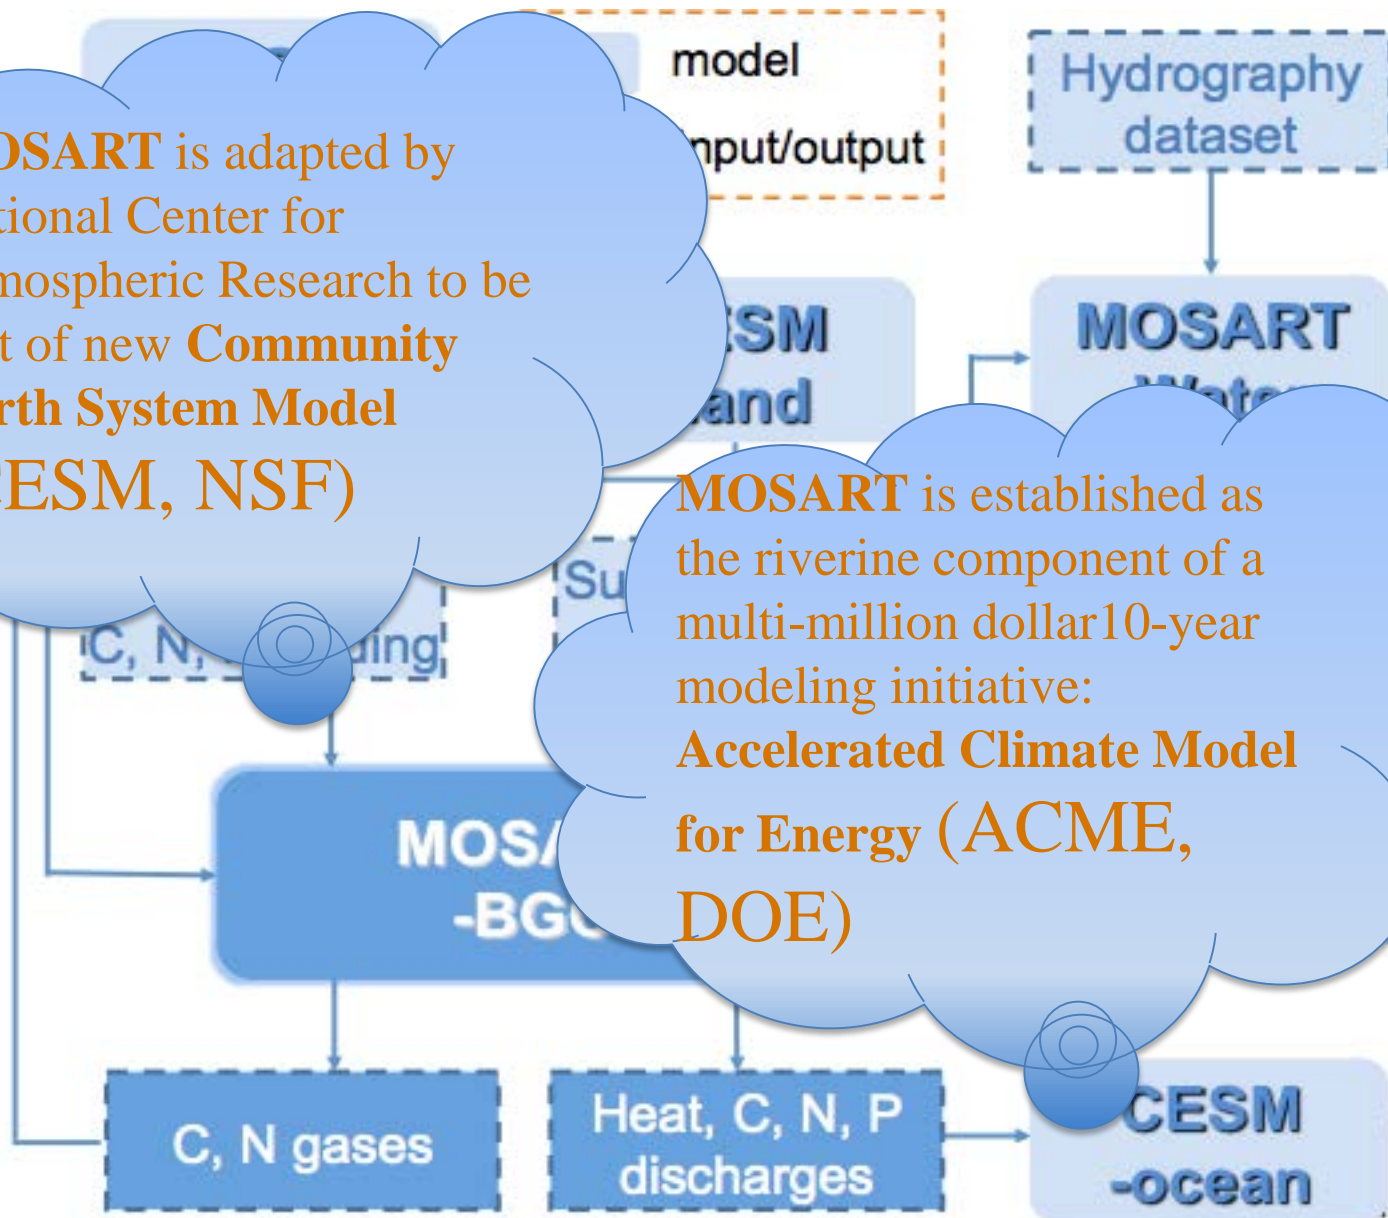

Understand and predict multiscale nonlinear system behaviors of
water-food-energy-environment nexus
and their feedbacks to climate change dynamics

Future research

MOSART is adapted by National Center for Atmospheric Research to be part of new **Community Earth System Model (CESM, NSF)**

MOSART is established as the riverine component of a multi-million dollar 10-year modeling initiative: **Accelerated Climate Model for Energy (ACME, DOE)**

Wenhua Wan

Visiting student from Tsinghua University, China

Working on hydrological drought under climate change and human interventions

Yuan (Navy) Zhuang

Visiting student from Tsinghua University, China

Working on global streamflow and temperature simulations under future climate, socio-economic and technologic scenarios

Wondmagegn (Wondie) Yigzaw

Ph.D., Tennessee Tech University

Working on reservoir stratification module within MOSART

Man Gao

Visiting student from Hohai University, China
Working on meta-analysis of macro-pore flow

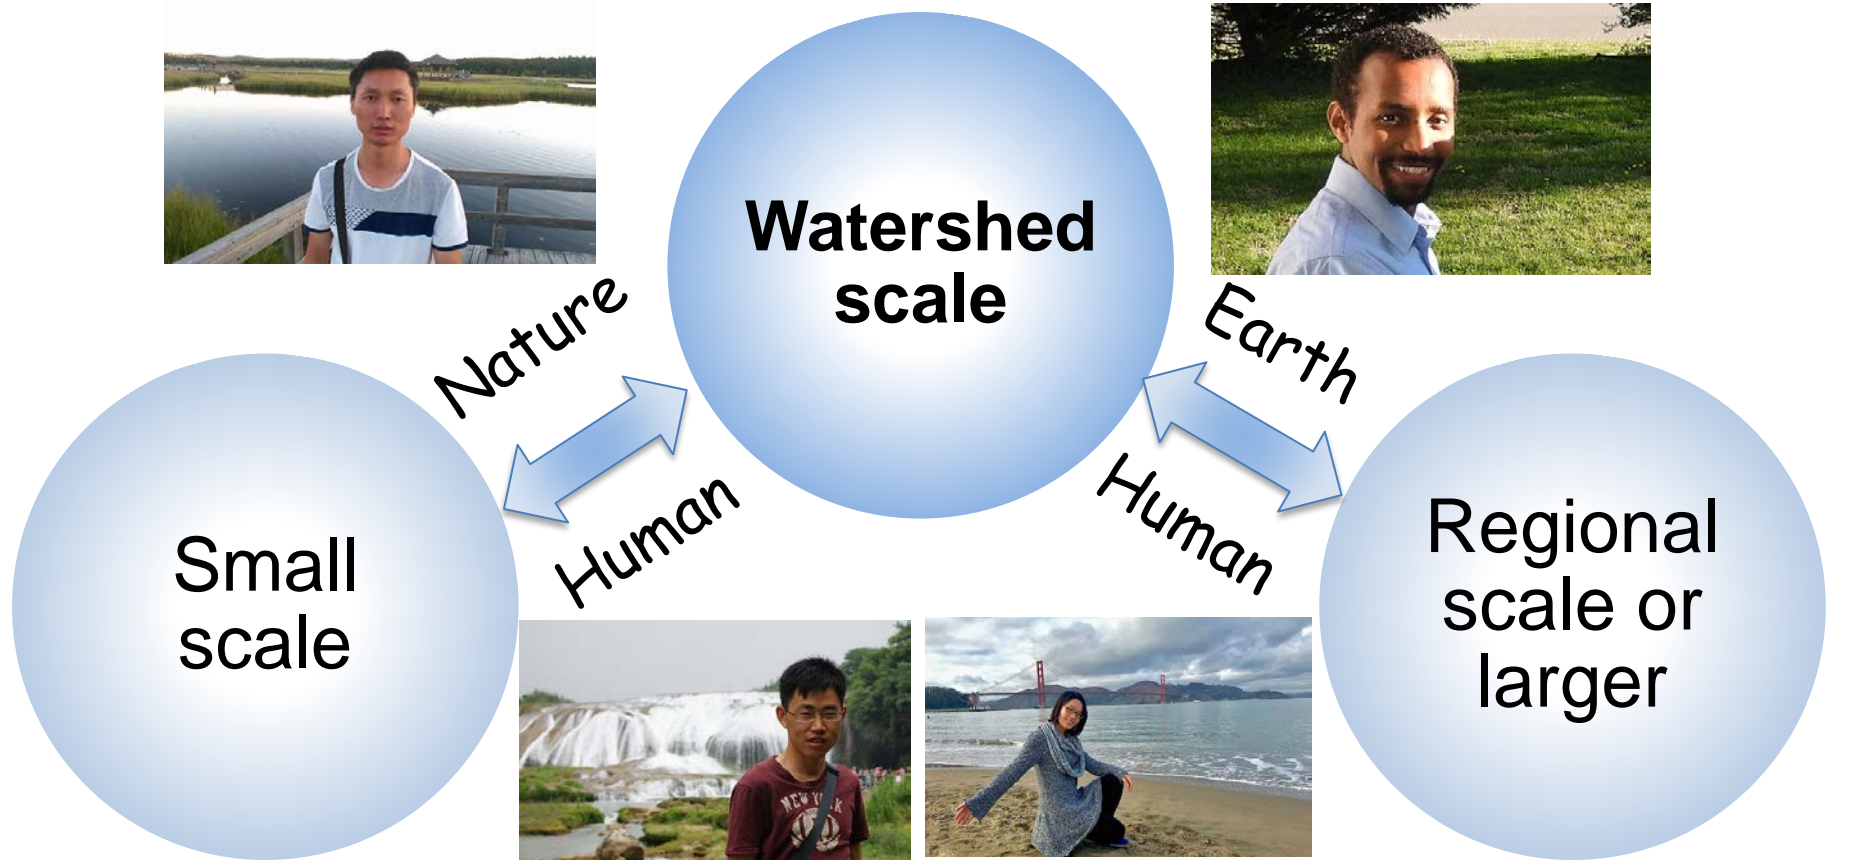

Dengfeng Liu

Ph.D., Tsinghua University

Working on modeling and data analysis of macro-pore flow

Summary

**Watershed hydrology
beyond "watersheds"**

A subbasin-based framework to represent land surface processes in an Earth system model

T. K. Tesfa¹, H.-Y. Li¹, L. R. Leung¹, M. Huang¹, Y. Ke², Y. Sun³, and Y. Liu¹

Grid-based representation (CLM)

Subbasin-based representation (DCLM)
